Dunagan, N. "Strategic Search in Patenting"

I develop a three-player game-theoretic model of patenting. An *applicant* chooses how extensively to search for prior art, determining the information brought into the patenting process and the claimed patent breadth. An *examiner* conducts additional search and might narrow the claimed breadth. A *challenger* conducts additional search and might challenge the patent. The public record from earlier search affects the likelihood of challenge by affecting the informativeness of later search. My equilibrium characterization yields comparative statics for how search and breadth respond to challenger filing costs, procedural standards, and examiner capacity. These results generate testable implications for patent breadth, grant outcomes, and post-grant challenge behavior.

Dunagan, N. "Strategic Search in Patenting: An Empirical Investigation"

Using a newly constructed dataset linking U.S. patent applications and grants through 2020 and an exposure-based difference-in-differences design, I find that greater exposure to post-grant review leads applicants and examiners to pursue narrower patent claims.
